

Introduction

Running the payroll of a business is an important but complicated way of working. Payroll does not just involve paying employees accurately and on time, but must also be in line with labor laws, tax requirements, and applicable company policy. As a business grows in size there is also an increase in volume, and complexity, of employee-related data. Employee data can include hours worked, vacation days, bonuses, and deductions—each of which can take considerable administrative effort. Managing payroll is cumbersome at best, and if mishandled, could create large penalties and legal issues—an efficient and defensible payroll process is a pillar of a sustainable business operation.

This project specifically deals with a problem that still exists due to entrenched practices of using manual systems for tracking payroll and attendance. These systems are well-known to be very time-consuming processes that can be prone to human error and the potential for costly errors related to pay and tax calculations (Faurie, 2025). In addition, manual systems do not provide real-time data therefore there is a lack of immediacy related to when attendance is taken, thus leading to inaccurate attendance records and an overall lack of transparency (Faurie, 2025). In summary, these ongoing inefficiencies and inaccuracies create a lasting negative impact on the workforce including frustration for employees, diminished morale, and reduced trust in the organization.

To address these problems, the solution in this paper is to design a secure, centralized Employee Payroll Management System. The system will implement a secure login module to safeguard sensitive information and reassign any role in a payroll transaction to only authorized users. This system will contain a full CRUD (Create, Read, Update, and Delete) functionality to enable administrators to manage employee profiles, salary structure, bonuses, attendance, and tax information easily. The system will also significantly decrease the manual effort and possible mistakes for complicated tasks. This solution will generate a transparent, accurate, and efficient payroll process, reduce administrative time, ensure compliance, and increase employee satisfaction overall.

General Problems:

1. Operational and Efficiency Problems

Excessive Time Consumption: Manually calculating hours worked, overtime, tax withholdings, and deductions for each employee is an incredibly slow and labor-intensive process. This administrative burden ties up HR and management staff for hours or even days each pay period.

2. Financial and Accuracy Problems

High Potential for Human Error: Every manual data entry and calculation is an opportunity for a mistake. Common errors include typos in hours worked, incorrect pay rates, miscalculated tax deductions, and mistakes in applying overtime rules.

3. Compliance and Security Problems

Risk of Non-Compliance: Labor and tax laws are complex and frequently change. Manually keeping track of regulations regarding minimum wage, overtime, and tax filings is extremely challenging and increases the risk of non-compliance, which can lead to audits, fines, and severe legal penalties.

Data Security Risks: Storing sensitive employee information—such as bank details, government identification numbers, and salary information—in spreadsheets or physical filing cabinets is inherently insecure. This data is vulnerable to unauthorized access, theft, or loss due to fire or other disasters.

4. Employee-Related Problems

Increased Employee Turnover: If employees cannot rely on being paid accurately and on time, they are more likely to seek employment elsewhere. Payroll issues are a common driver of employee dissatisfaction and turnover.
